ABSTRACT

The invention relates to an electrostatic microswitch which is intended to connect electrically two strip conductors which are disposed on an insulating support (21), the two strip conductors are connected electrically by conducting means (38) which are provided in the central part of deformable means (28) which can be deformed in relation to the support under the effect of an electrostatic force generated by control electrodes (25, 48; 26, 58). The control electrodes are distributed facing one another on the deformable means and the support, such as to form capacitive means around the aforementioned conducting means. The control electrodes are associated with insulating stop elements (35, 36) which are provided in order to prevent a short circuit between electrodes of the capacitive means during the deformation of the deformable means. The distance between the deformable means and the ends of the strip conductors is less than or equal to the distance between the insulating stop elements control electrodes and associated with the control electrodes located opposite.
